A Peripheral Vascular Self-Expanding Stent is a medical device designed to open and support blocked or narrowed peripheral arteries, such as those in the legs, arms, or neck. It is made from materials like Nitinol (a nickel-titanium alloy) or other metals that have shape memory properties, allowing the stent to automatically expand to its intended shape when deployed in the blood vessel. Peripheral Vascular Self-Expanding Stent and Self-Expanding Stent are related but refer to different applications. Both stents are designed to provide support to blood vessels by expanding within them, but their specific use cases distinguish them. Peripheral vascular stents are generally larger and more robust to handle the increased stress found in the legs and arms.
