Abstracts

According to our (Global Info Research) latest study, the global Phage Display Library Screening Services market size was valued at US\$ 210 million in 2025 and is forecast to a readjusted size of US\$ 333 million by 2032 with a CAGR of 6.7% during review period.

Phage Display Library Screening Services are specialized biotechnological services that isolate phage clones displaying peptides, antibody fragments, or proteins with specific target-binding affinity from preconstructed diverse libraries (typically containing 10⁷–10¹⁰ unique clones). The core workflow typically involves incubating the phage library with purified target antigens, cell surface receptors, or intact cells, followed by stringent washing steps to remove non-specifically bound phages, elution of specifically bound clones via pH adjustment, competitive displacement, or protease cleavage, and amplification of target-specific phages through bacterial infection; multiple iterative rounds of this biopanning process are conducted to enhance binding affinity and specificity, with final validation including DNA sequencing to identify the displayed molecule's sequence, binding affinity measurement using techniques like ELISA or SPR, and functional characterization to confirm biological activity. Tailored to diverse client needs, these services support various screening formats—such as solid-phase, solution-phase, cell-based, and in vivo screening—and are widely applied in therapeutic antibody discovery, peptide drug development, diagnostic reagent production, protein-protein interaction mapping, and epitope identification, enabling clients to accelerate their research and development timelines without the need to invest in specialized infrastructure or technical expertise.
