Polylactic acid vascular stent is a vascular stent made of polylactic acid, a biodegradable material. Polylactic acid is a biodegradable polymer that can be degraded into non-toxic lactic acid by enzymes in the body, and then metabolized and excreted by the body. This property enables the polylactic acid vascular stent to gradually degrade and be absorbed by the human body after completing its task of supporting and repairing blood vessels, avoiding the problem of traditional metal stents needing to remain in the body for a long time.
