## Abstracts

According to our (Global Info Research) latest study, the global Polyimide FPC Stiffener market size was valued at US\$ 89.79 million in 2025 and is forecast to a readjusted size of US\$ 116 million by 2032 with a CAGR of 4.0% during review period.

Global production of Polyimide FPC Stiffener is projected to reach 4.5 million square meters by 2025, with an average selling price of US\$19 per square meter. The industry's average gross margin is approximately 27%.

Polyimide (PI) is a high-performance engineering polymer widely used as the base film of FPCs themselves, which naturally positions it as a compatible stiffener material. PI offers a combination of excellent heat resistance, good mechanical strength, electrical insulation, and chemical stability. Its elastic modulus is lower than that of FR-4 or metals, enabling reinforcement without completely eliminating local flexibility.

From a reliability standpoint, PI demonstrates stable behavior under thermal cycling and soldering environments, which is critical for modern electronics assembly.

PI stiffeners are typically produced by die cutting, punching, or laser cutting PI sheets or films into predefined geometries. In thickness-critical applications, multiple PI layers may be laminated together or co-laminated with epoxy adhesive films.

Bonding to the FPC is commonly achieved using thermosetting bonding sheets via hot-press lamination, followed by a curing process to stabilize adhesion. Pressure-sensitive adhesive (PSA) attachment may be used in less demanding emphasize cost and cycle time.
