According to our (Global Info Research) latest study, the global Porcine Pericardium Resorbable Membrane market size was valued at US\$ 159 million in 2024 and is forecast to a readjusted size of USD 286 million by 2031 with a CAGR of 8.9% during review period.

A porcine pericardium resorbable membrane is a biologically derived medical material commonly used in dental and surgical procedures for guided tissue regeneration (GTR) and guided bone regeneration (GBR). It is made from the pericardial tissue of pigs, processed to retain its natural collagen structure while eliminating antigenicity to ensure biocompatibility. This membrane serves as a barrier to prevent soft tissue invasion into bone defects, promoting effective healing and regeneration of underlying bone and tissue. Over time, it resorbs naturally within the body, eliminating the need for a second surgical procedure for removal. Widely used in periodontal treatments, implantology, and maxillofacial surgeries, porcine pericardium resorbable membranes offer excellent handling properties, strength, and predictable resorption rates, making them a trusted choice for clinicians.
