According to our (Global Info Research) latest study, the global Positively Charged Slide market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Positively charged glass slides are a special type of glass slides with a positive charge on their surface after special treatment. Positively charged glass slides apply positive charges on their surface and use the principle of mutual attraction between positive and negative charges to firmly adsorb samples such as cells and tissue sections on the glass slide. This adsorption is not only stable, but also can maintain the morphological and structural characteristics of the sample, which is convenient for subsequent observation, staining and analysis. The positive charge on the surface of positively charged slides is permanent and denser, with stable performance, long shelf life, and better adhesion to histological and cytological samples. Positively charged slides are suitable for many fields such as pathological tissue sections and immunohistochemistry, and are particularly suitable for the preparation process that requires high temperature (above 80°C). In addition, to meet different needs, positively charged slides can provide writing surfaces in a variety of colors, such as orange, yellow, green, pink, blue, etc.

Positively charged glass slides are a special type of glass slide market. They have a positive charge on their surface and are used in specific biological, medical or scientific research fields, such as cell culture, tissue section staining, etc., to enhance the

adhesion of samples. With the rapid development of life sciences, medical research and biotechnology, the demand for high-quality glass slides is increasing. As a special type of glass slides, positively charged glass slides also benefit from this trend. In addition, with the continuous development of materials science, surface treatment technology and nanotechnology, the performance and quality of positively charged glass slides are expected to be further improved. In summary, the market for positively charged glass slides is expected to continue to grow in the future.
