Abstracts

According to our latest research, the global Post Processor market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

A post-processor is a software component or program used in the field of computer-aided manufacturing (CAM). It's part of the process that takes a toolpath generated by CAM software and translates it into the specific commands needed by a particular machine tool's controller to actually make the part.

3D-CAD data is becoming increasingly popular in the manufacturing field to facilitate product data linkage across departments and advance verification in the upstream process. However, in parts machining, multitasking machines are becoming more common in order to respond to diversifying production forms such as process integration and part shapes, and easy conversion to NC programs using 3D-CAM is required. A Post Processor is required to perform this conversion accurately.

Typically, company-specific NC machines and CAM systems have corresponding conversion libraries. A typical Post Processor is required for each control or NC machine tool. However, some post processors can register controller- or NC machine tool-specific specifications in parameter form and switch to the NC data corresponding to each machine with a simple operation.
