Powder-free intraoral scanners are advanced dental devices used to capture detailed digital impressions of a patient's oral cavity without the need for a contrast agent, such as titanium dioxide powder. Traditional intraoral scanners often required a fine layer of powder to be applied to the teeth and soft tissues to reduce glare and improve accuracy. However, modern powder-free scanners use sophisticated optical technology, such as structured light or laser, to generate precise 3D images directly, enhancing patient comfort, reducing mess, and streamlining the dental workflow.
