Abstracts

According to our (Global Info Research) latest study, the global Powder Injection Molding Feedstock market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

Feeding means that a certain powder and a binder are uniformly mixed in a certain proportion at a certain temperature to obtain a powder and binder mixture suitable for injection molding. The preparation of uniform feed is the key to obtain high-precision powder injection molding products. If the feed is not mixed uniformly, the binder will produce defects such as deformation and uneven sintering shrinkage during the degreasing process, thereby increasing the size deviation of the final sintered body.
