## Abstracts

According to our (Global Info Research) latest study, the global Pressurised Feedwater Deaerator market size was valued at US\$ 724 million in 2025 and is forecast to a readjusted size of US\$ 1109 million by 2032 with a CAGR of 6.2% during review period.

In 2025, the global installed capacity of new pressurized feedwater deaerators was approximately 51,800 units, with a unit price of USD 13,600 and a gross profit margin of approximately 18%-29%. A pressurized feedwater deaerator is a core boiler water treatment device that operates under controlled pressure (typically 0.2–0.6 MPa) and reduces dissolved oxygen (DO) and free CO<sub>2</sub> in feedwater to 0.02–0.03 mg/L through steam heating and a two-stage spray-pallet structure. The main body consists of spray heads, a water distribution tray, a pressure vessel cylinder, a steam distributor, a condensate vent valve, a pressurized section safety valve, level and pressure gauges, a collection tank, and a makeup water control system. Typical parameters include: deaerated water temperature 104–160 °C (matching the operating pressure), operating pressure 0.2–0.6 MPa, steam consumption per ton of water 2.8–4.2%, influent DO 2–6 mg/L, effluent DO 0.02 mg/L, and materials primarily composed of corrosion-resistant steels such as SA-516 Gr.70 and SS304/316L; welds are subjected to RT/UT inspection. In a typical 10–35 t/h boiler room, it is usually equipped with one set of pressurized feedwater deaerator; in a regional energy station, 2–3 sets can be configured to operate in parallel to meet the peak load water replenishment demand.
