According to our (Global Info Research) latest study, the global Print Digital Denture market size was valued at US\$ 328 million in 2024 and is forecast to a readjusted size of USD 406 million by 2031 with a CAGR of 3.1% during review period.

Print Digital Dentures usually refer to the use of 3D printing technology to complete the direct components of denture products or the application of 3D printing technology in a certain key process, thereby replacing the traditional manual denture related processes.

Printing digital dentures refers to the process of using digital technology, such as 3D printing technology, to manufacture dentures. The traditional denture production process involves multiple steps, including impression taking, model making, and denture production. However, the emergence of digital technology has made denture production more efficient, accurate and personalized. Use an oral scanner to scan the patient's mouth to obtain accurate oral structure data. In computer software, a dentist or technician can digitally design a denture based on the patient's oral data, including shape, size, and bite. Using 3D printing technology, the designed denture model is printed layer by layer. Printing materials are usually biocompatible resin materials suitable for oral applications. The printed denture model may require some post-processing, such as removing support structures, smoothing surfaces, etc. Some digital dentures may require further sintering or other processing steps to ensure their quality and fit in the mouth. The completed digital denture will be fitted into the patient's mouth, followed by necessary occlusal and adaptation adjustments.
