A projection perimeter is a device used to measure and assess the human visual field. The visual field is the range of space that the eye can see when it is fixed on a certain point. The projection perimeter maps the visual field by projecting light dots of varying brightness and size onto a hemispherical screen and asking the subject to report when they can see these light dots. The device is often used to diagnose and monitor eye diseases such as glaucoma, retinal diseases, and optic neuropathy. By understanding changes in the subject's visual field, doctors can better plan treatment plans and evaluate the effectiveness of treatment. Projection perimeters are often used in ophthalmology and visual science research.
