Abstracts

According to our (Global Info Research) latest study, the global PROTAC Therapy Drugs market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ 397 million by 2032 with a CAGR of 24.7% during review period.

PROTAC therapy drugs are a class of small-molecule targeted protein degradation therapies based on Proteolysis-Targeting Chimera (PROTAC) technology. Instead of inhibiting a disease-causing protein's activity, PROTAC drugs work by inducing the selective degradation of the target protein inside the cell. They achieve this by simultaneously binding the target protein and an E3 ubiquitin ligase, bringing the two into proximity so the target is tagged with ubiquitin and subsequently destroyed by the cell's proteasome.

PROTAC therapy drugs are an emerging class of small-molecule medicines designed to treat disease by selectively removing, rather than merely inhibiting, specific proteins through the cell's own ubiquitin–proteasome degradation system. This “event-driven” mechanism addresses several persistent pain points in drug development: it can overcome situations where conventional inhibitors lose effectiveness due to resistance mutations, it can achieve deeper and more sustained pathway control by eliminating the target protein altogether, and it opens new possibilities for proteins that are difficult to modulate with classic active-site binding strategies. Industry momentum is being fueled by rapid advances in target biology and structural design, growing confidence in the translational value of targeted protein degradation, and strong demand in areas such as oncology and immune-mediated diseases where durable responses and differentiation matter most. Looking ahead, market potential is supported by an expanding pipeline of degrader programs, improving chemistry and drug-like properties that enable more

practical dosing and broader tissue reach, and the likelihood that successful PROTACs will complement—rather than simply replace—existing targeted therapies, creating a meaningful new layer of precision medicine built around controlling protein levels instead of just protein activity.

PROTAC Therapy Drugs' upstream raw materials mainly include target protein (POI) ligands, E3 ligase ligands, excipients, etc. Typical suppliers include Bio-Techne, Merck, Sigma-Aldrich, Enamine, etc. Downstream applications are mainly in the treatment of cancer, immune diseases, etc.
