Pulling and tensioning equipment refers to specialized tools and machinery designed for the construction, maintenance, and repair of overhead power lines and other cable systems. These machines are essential for ensuring the safe and efficient installation of conductors, fiber-optic cables, or ropes across various terrains. They are primarily used in the utility, telecommunications, and construction industries. The two primary categories are pulling machines and tensioning machines, with modern designs often combining these functions into puller-tensioner machines.

The demand for infrastructure construction is growing worldwide. With the acceleration of urbanization and the increase in transportation demand, the demand for power grid tensioning equipment in infrastructure construction such as railways, subways, light rails and highways is increasing. This demand has driven the rapid development of the power grid tensioning equipment industry. Intelligence and automation. Enterprises have innovated and improved in product design, control systems and energy efficiency, improving the operating efficiency and safety of equipment. Internet of Things and big data applications: Operation and maintenance services are gradually shifting to a data-driven model, improving equipment reliability and efficiency and reducing maintenance costs through real-time monitoring and fault prediction. Policy support. Government policy support has provided a good environment for the development of the power grid tensioning equipment industry. The attention paid by governments to power infrastructure and policy support have promoted the market demand for power grid tensioning equipment. The gradual formulation and improvement of relevant industry

standards will help improve product quality and market competitiveness and promote the standardized development of the industry.
