Abstracts

According to our (Global Info Research) latest study, the global Pyrethrins Technical market size was valued at US\$ 299 million in 2025 and is forecast to a readjusted size of US\$ 545 million by 2032 with a CAGR of 8.9% during review period.

Pyrethrum extract is a high-concentration active insecticidal substance extracted from pyrethrum flowers. It primarily contains natural pyrethrins (Pyrethrins I, II, etc.) and is used as a basic raw material for pesticides, public health insecticides, and animal deworming products without further processing or dilution. It features rapid insect knockdown, low residue, relatively low toxicity to mammals, and easy biodegradability, making it an important raw material for the industrial production of pyrethrum-based formulations.

The pyrethrum extract industry chain mainly includes raw material cultivation, flower harvesting, drying and processing, extraction and concentration, and formulation production. The upstream involves the cultivation and acquisition of pyrethrum flowers, with raw material costs accounting for approximately 40%-50% of the total cost; the midstream involves the extraction and refining of pyrethrins, which is the core link, with a gross profit margin generally between 25%-35%; the downstream involves the sale of the raw material and the preparation and application of formulations, with a higher gross profit margin of 30%-50%, especially for standardized raw materials targeting organic agriculture or high-end daily chemical markets, where the profit margin is even greater. The overall industry chain is characterized by high capital and land investment at the front end, significant technological barriers in the middle, and stable demand and high added value at the downstream end.

In 2025, the global production of pyrethrum extract reached 3986 tons, with an average price of US\$73,000 per ton.
