The Radial Artery Access Device (RAD) is a medical device used to provide vascular access through the radial artery during interventional cardiac surgery. Traditionally, coronary interventional procedures (such as coronary balloon dilatation or stent implantation) are usually performed through an arterial puncture in the patient's thigh (femoral artery) or wrist (radial artery). The radial artery access device makes the surgical procedure more comfortable and convenient by achieving vascular access at the radial artery in the wrist. Radial artery access has several advantages over access from the thigh.
