Radiant Heat Warmers are medical devices used to provide targeted warmth to patients, particularly newborns, by emitting heat from a controlled radiant source, usually infrared light. These warmers are designed to maintain the body temperature of infants, especially premature or low-birth-weight babies, without direct contact. The heat is directed towards the baby's body to ensure warmth while allowing for easy monitoring and medical interventions. Radiant heat warmers are commonly used in neonatal intensive care units (NICUs) and have adjustable settings for temperature and intensity, helping to prevent hypothermia and promote the infant's overall health and stability.
