Reinforced braided catheter shafts are flexible, high-strength tubes used in various medical procedures to deliver or remove fluids, administer medications, or access internal organs and blood vessels. These catheters are constructed with an internal braided reinforcement, typically made from materials such as stainless steel, aramid fibers, or high-strength polymers. The braided structure provides enhanced mechanical properties, including increased strength, flexibility, kink resistance, and precise control, making these catheter shafts suitable for navigating complex anatomical pathways and withstanding the mechanical stresses encountered during medical procedures.
