According to our (Global Info Research) latest study, the global Resorbable Embolization Microspheres market size was valued at US\$ 470 million in 2024 and is forecast to a readjusted size of USD 1012 million by 2031 with a CAGR of 10.6% during review period.

Resorbable embolization microspheres are biodegradable medical devices used in minimally invasive procedures to block blood flow to targeted tissues, such as tumors or arteriovenous malformations. These microspheres are typically made from biocompatible materials like polylactic acid (PLA) or gelatin, designed to degrade safely within the body over time. Delivered via a catheter into the blood vessels, they provide temporary occlusion, allowing for localized treatment while minimizing damage to surrounding tissues. Resorbable embolization microspheres are widely used in interventional radiology for conditions like uterine fibroids, liver tumors, and post-traumatic bleeding, offering effective, targeted therapy with reduced long-term complications.
