A reusable hemostatic valve is a medical device used to control bleeding during surgery. This valve is designed to maintain hemostasis when a blood vessel is isolated during surgery, while being able to easily release blood flow when needed without the need for re-ligation or the use of additional hemostatic tools.

The working principle of a hemostatic valve usually involves a mechanical device that can seal the blood vessel and stop blood flow when needed, and quickly release it when blood needs to be restored. This type of valve can be mechanical, electromagnetic, or based on biocompatible materials to suit different surgical needs and patient conditions.
