## Abstracts

According to our latest research, the global Roll Grooving Service market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

Roll grooving moves a small portion of the pipe wall orbitally by a cold-forming process. The end of the pipe is placed between the roll set of a grooving machine. As the roll set closes, the pipe compresses as it rotates. This leaves a smooth recessed groove around the outside diameter and an indent on the inside diameter of the pipe being grooved. Roll grooving can be applied on heavy and light-walled pipes without weakening them against corrosion. However, if the pipe wall is too thick, cut grooving the pipe will provide a more reliable groove.
