According to our (Global Info Research) latest study, the global Rubber Type Toughener for Epoxy Resin market size was valued at US\$ 109 million in 2024 and is forecast to a readjusted size of USD 144 million by 2031 with a CAGR of 4.0% during review period.

Rubber elastomer forms blocks through the reaction of its active end groups (such as carboxyl, hydroxyl, amino) with active groups (such as epoxy, hydroxyl, etc.) in epoxy resin; the key to successful toughening is to properly control the phase separation process of reactive rubber in epoxy resin system. The rubbers that have been studied or applied for toughening and modification of epoxy resin include carboxyl-terminated polyether, polyurethane liquid rubber, polysulfide rubber, fluorine-containing elastomer, chloroprene rubber, nitrile rubber, butyl acrylate rubber, etc. By adjusting the solubility parameters of rubber and epoxy resin, controlling the island structure formed by phase separation during gelation, the rubber particles existing in the dispersed phase can stop cracks, branch cracks, and induce shear deformation, thereby improving the fracture toughness of epoxy resin.
