The segmented bending control guide system is a medical device that is mainly used to establish a pathway for the introduction of devices in the heart chambers, especially playing a key role in left atrial appendage occlusion. The segmented bending control guide system usually consists of a segmented bending control sheath, a dilator, a delivery cable, a loader, a hemostatic valve, etc. Among them, the segmented bending control sheath is the core component of the system, which is composed of a variety of materials such as PTFE (polytetrafluoroethylene), stainless steel, Pebax (a thermoplastic elastomer), nickel-titanium alloy, etc. The selection of these materials is intended to ensure the flexibility, strength and biocompatibility of the sheath.
