Abstracts

According to our latest research, the global Selective Catalytic Reduction Technology market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

Selective catalytic reduction technology is currently the most widely used flue gas denitration technology in the world. It uses reducing agents (such as NH₃, urea, etc.) under the action of a catalyst to react preferentially and selectively with NO_x in the flue gas, reducing it to nitrogen and water, thereby achieving the purpose of denitrification.

SCR technology has many advantages such as high denitrification efficiency, good product selectivity, and wide application range. Its maximum denitrification efficiency can reach more than 90%, and the products are nitrogen and water, with no by-products and no secondary pollution. In addition, the SCR technology device has a simple structure, reliable operation, and easy maintenance, so it has broad application prospects in the field of flue gas denitration.

The key to SCR technology is to control the escape rate of NH₃ and the conversion rate of SO₂ while ensuring the denitrification efficiency to ensure the safe and stable operation of the SCR system. In practical applications, it is necessary to select appropriate catalysts and reducing agents based on key parameters such as specific flue gas composition and dust content to achieve the best denitrification effect.
