Abstracts

According to our (Global Info Research) latest study, the global Self-crosslinking Resin market size was valued at US\$ 4414 million in 2025 and is forecast to a readjusted size of US\$ 6670 million by 2032 with a CAGR of 6.1% during review period.

Self-crosslinking resin is a class of polymer resin—most commonly acrylic, polyurethane, vinyl, or hybrid systems—that contains built-in reactive functional groups (such as hydroxyl, carboxyl, amide, N-methylol, or blocked isocyanate groups) that can crosslink internally during drying, heating, or curing without the need for an external crosslinker, forming a durable three-dimensional network that improves film hardness, chemical resistance, adhesion, and mechanical stability; its supply chain begins with upstream petrochemical feedstocks (acrylic acid, methacrylates, vinyl monomers, diols, isocyanates), followed by monomer synthesis and polymerization at resin manufacturers into emulsions or solutions, downstream formulation into coatings, adhesives, inks, sealants, and textile or construction binders by formulators and OEMs, and finally distribution through direct sales or specialty chemical distributors to end users in architectural coatings, industrial coatings, packaging, automotive, wood finishes, and textiles. In 2025, the global self-crosslinking resin market produces about 1.45 million tons versus a capacity of 1.75 million tons, with average prices of USD 2,700–5,200 per ton and an average gross margin of around 33%.
