## Abstracts

According to our (Global Info Research) latest study, the global Self-retaining Ball Valve market size was valued at US\$ 996 million in 2024 and is forecast to a readjusted size of USD 1234 million by 2031 with a CAGR of 3.1% during review period.

A self-retaining ball valve is a valve mainly composed of a valve body and a drive mechanism. The 'self-retaining' in its name means that after the valve reaches a certain position (such as fully open or fully closed), it can maintain that position unchanged without continuous external energy support. The self-retaining ball valve can be operated manually or driven electrically. In the electric mode, when the valve opening (closing) signal is received, the drive mechanism is energized and drives the ball valve core to rotate. After the valve core is turned to the right position, the power inside the drive mechanism will be automatically cut off. At this time, the valve position mechanical indicator will point to the corresponding valve position, and the valve position switch will output a passive valve position signal. This process realizes the self-retaining function of the valve.
