A self-retaining surgical retractor is a medical instrument used during surgery to hold back tissues or organs, providing a clear and stable view of the surgical site. Unlike handheld retractors, self-retaining retractors are designed to stay in place on their own, typically using a locking mechanism or a frame that can be adjusted and secured. This allows the surgeon to have both hands free to operate, improving efficiency and precision during the procedure. These retractors are commonly used in various types of surgeries, including abdominal, orthopedic, and neurosurgical operations.
