Semi-automatic clinical chemistry analyzer is a microcomputer in vitro diagnostic instrument that integrates optics, mechanics, and automatic control. It is used in conjunction with relevant reagents to perform quantitative determination of biochemical items. It is widely used in various hospitals and scientific research institutions. It has the characteristics of high accuracy, good repeatability, and complete functions. Semi-automatic clinical chemistry analyzer is based on two measurement methods: optical technology and electrochemical technology. Its working principle is similar to that of fully automatic biochemical analyzer. The main difference is that semi-automatic analyzer is more suitable for small laboratories and medical institutions. This is because compared with fully automatic analyzer, semi-automatic analyzer can process fewer samples at a time.
