According to our (Global Info Research) latest study, the global Silane Crosslinker market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

Silane crosslinking agent refers to a silane containing two or more silicon functional groups, which can act as a bridge between linear molecules, so that multiple linear molecules or slightly branched macromolecules and polymers can be bonded and crossed with each other. It forms a three-dimensional network structure to promote or mediate the formation of covalent bonds or ionic bonds between polymer molecular chains. The cross-linking agent is the core part of the one-component RTV silicone rubber, and it is the basis for determining the cross-linking mechanism and classification of the product. According to the different condensation reaction products, one-component RTV silicone rubber can be divided into different types such as deacidification type, deketoxime type, dealcoholization type, deamination type, deamidation type and deacetone type.
