Silicone rubber for bite registration is a material used in the dental field, mainly for the process of recording and measuring the bite relationship between the upper and lower teeth. It is made of silicone rubber, which has excellent elasticity and durability, and can accurately capture the contact points and pressure distribution of the teeth during the bite process. This material will form an accurate bite impression after curing, helping dentists to ensure that the restorations (such as crowns, bridges or dentures) can match the patient's natural tooth bite when making dental restorations (such as crowns, bridges or dentures). Silicone rubber is widely used in dental bite registration due to its high precision and stability.
