A Small Molecule Liquid Chromatography (LC) System is a specialized analytical tool used to separate, identify, and quantify small organic molecules, typically with molecular weights less than 900 Daltons. This system utilizes liquid chromatography techniques, where a liquid mobile phase passes through a column filled with a stationary phase to separate small molecules based on their chemical properties, such as polarity, charge, or size. Small molecule LC systems are widely used in pharmaceutical research, chemical analysis, and biochemistry for applications such as drug development, metabolite profiling, and quality control. These systems offer high precision and resolution, enabling researchers to analyze complex mixtures of small molecules, detect impurities, and study molecular interactions. They are essential in areas like pharmaceutical development, environmental testing, and clinical diagnostics.
