## Abstracts

According to our (Global Info Research) latest study, the global Split Type Bone Conduction Headphones market size was valued at US\$ 350 million in 2024 and is forecast to a readjusted size of USD 430 million by 2031 with a CAGR of 3.0% during review period.

Bone conduction technology is first introduced for hearing aid and military communication purpose. As sound can be conducted to the inner ear through the bone of the skull. This means that the sound waves are bypassing the outer and middle ear (where the eardrum is located) and directly stimulating the inner ear (hearing organ). Split Type Bone Conduction Headphones are the latest generation offering excellent sound quality and portability.

Compared with traditional earphones, bone conduction earphones are more comfortable. Due to the special properties of bone conduction technology, this type of earphones does not need ear plugs, and can directly transmit sound to the auditory nerve through the jaw bone to allow users to hear the sound. Therefore, when wearing bone conduction headphones, the sound of the external environment will not be lost. It has unique advantages in outdoor, driving and sports scenarios, and the open design will not cause hearing damage.
