According to our (Global Info Research) latest study, the global Split Type Eddy Current Sensor market size was valued at US\$ 367 million in 2024 and is forecast to a readjusted size of USD 457 million by 2031 with a CAGR of 3.2% during review period.

Eddy current sensor is a sensing device based on eddy current mutual inductance effect, which can realize high-precision detection of internal defects and trace displacement of the measured object. Due to its significant advantages such as non-contact measurement, wide frequency response, and strong anti-interference ability, it is widely used in important fields such as equipment non-destructive testing and online condition monitoring.

The split eddy current sensor is a sensor used for non-contact measurement of parameters such as surface defects, thickness, size and material properties of metal parts. It utilizes the principle of eddy currents to perform measurements and is commonly used in industrial applications such as quality control, material testing, and structural health monitoring. The principle of eddy current is based on Faraday's law of electromagnetic induction. When the surface of a metal part is in a changing magnetic field, an eddy current will be generated on the metal surface. The properties of these eddy currents are affected by the metal material and surface imperfections, and information about the properties of the metal part can be obtained by measuring changes in the eddy currents.
