According to our (Global Info Research) latest study, the global Stereotactic Radiation Therapy (SRT) System market size was valued at US\$ 304 million in 2024 and is forecast to a readjusted size of USD 1252 million by 2031 with a CAGR of 22.7% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Improvements in tumor localization, imaging and dosimetry in radiotherapy has allowed for the implementation of hypofractionated radiotherapy for disease sites where conventional fractionation (around 2 Gy per fraction) was previously the norm or where curative radiotherapy was not attempted. SRT comprises high-precision irradiation techniques that use multiple, photon radiation beams to deliver a high dose of radiation. Stereotactic localization, using frame-based or frameless techniques, is used to treat lesions. Regarding dose fractionation, SRT is divided into stereotactic radiosurgery (SRS), in which the total dose is delivered in a single treatment session, and stereotactic radiotherapy, in which the total dose is delivered in multiple fractions (usually less than 8 treatments). Originally this technique was only used when treating lesions located in the brain, however now a number of extra-cranial malignancies are treated using stereotactic localization (stereotactic body radiotherapy (SBRT)).
