Abstracts

According to our (Global Info Research) latest study, the global Sterile Endotracheal Tube market size was valued at US\$ 2457 million in 2024 and is forecast to a readjusted size of USD 3692 million by 2031 with a CAGR of 6.1% during review period.

A sterile endotracheal tube is a flexible plastic tube that is passed through the mouth and into the windpipe, which is connected to a ventilator that supplies oxygen to the lungs. When the patient is unable to breathe on their own, the endotracheal tube is inserted. The process of inserting the tube is called endotracheal intubation. Endotracheal tubes are mostly made of polyvinyl chloride (PVC) and are single-use only.

The global endotracheal intubation market is mainly driven by the increasing incidence of respiratory diseases such as pulmonary embolism and chronic obstructive pulmonary disease, the increase in the number of anesthesia activities during surgery, the rising trend of laryngeal masks being the preferred choice for anesthesia over ETT, and the increasing demand for intraoperative intubation. And increasing number of surgeries globally are the factors driving the market during the forecast period. Increasing prevalence of chronic respiratory diseases is expected to drive market growth. Chronic respiratory disease (CRD) can damage the airways and other lung structures, according to the U.S. Centers for Disease Control and Prevention. Chronic obstructive pulmonary disease (COPD), asthma, occupational lung disease, and pulmonary hypertension are the most common conditions. In addition to tobacco smoke, air pollution, occupational chemicals and dust, and recurrent lower respiratory illnesses in childhood are also risk factors. Asthma affects about 300 million people worldwide and is more prevalent in developed countries such as the United States.
