Abstracts

According to our (Global Info Research) latest study, the global Supercritical CO2 Extraction Machines market size was valued at US\$ 71.8 million in 2023 and is forecast to a readjusted size of USD 117 million by 2030 with a CAGR of 7.5% during review period.

Supercritical carbon dioxide extraction is a commonly used method to separate various components from the plant due to it producing a pure, clean, and safe product. Carbon dioxide reaches a supercritical state at 1071 psi and 31.1°C. When a molecule is in a supercritical state, it has properties of both liquid and gas.

The Supercritical CO2 Extraction Machine combines carbon dioxide, pressure, and temperature to separate specific compounds in plant materials for extraction.

Supercritical carbon dioxide (supercritical CO2) is a fluid in a special state with unique properties such as high diffusivity and low surface tension. It has shown wide application value in many fields.

In the field of application, supercritical CO2 extraction technology is undergoing significant technological optimization and innovation. By improving equipment design and optimizing process parameters, such as more accurately controlling extraction temperature, pressure, time and CO2 flow, extraction efficiency can be further improved and costs reduced.

In terms of equipment performance, supercritical CO2 extraction equipment is developing towards intelligence, automation, miniaturization and portability. This not only improves the stability of production and consistency of product quality, but also meets the needs of laboratory research, pilot production and some special application scenarios. At the same time, the stability and durability of the equipment are also enhanced, with better materials selected and the equipment structure optimized.
