The superficial scar radiotherapy system is a medical device specially used to treat superficial skin lesions and keloids. It uses low-energy X-rays or electron beams to accurately irradiate the target area, inhibit the growth of abnormal tissues and reduce scar tissue to achieve the therapeutic effect. This system has the advantages of high precision, non-invasiveness, and can effectively reduce side effects. It is widely used in the treatment of superficial lesions such as skin cancer and keloids.

The superficial scar radiotherapy system represents a significant advancement in modern medical technology in the field of non-invasive skin treatment. Through precise radiotherapy, these systems can effectively reduce keloids and other superficial skin lesions, providing patients with a better quality of life. As technology continues to develop, the superficial scar radiotherapy system will further optimize treatment effects and reduce side effects, becoming one of the core means of scar management, especially in those cases where traditional treatments have limited effects, showing unique treatment advantages.
