According to our (Global Info Research) latest study, the global Surface Mount Thermopile Infrared Sensor market size was valued at US\$ 339 million in 2024 and is forecast to a readjusted size of USD 419 million by 2031 with a CAGR of 3.1% during review period.

Thermopiles are designed to measure temperature from a distance by detecting an object's infrared (IR) energy. The higher the temperature, the more IR energy is emitted. The thermopile sensing element, composed of small thermocouples on a silicon chip, absorb the energy and produce an output signal. A reference sensor is designed into the package as a reference for compensation. Thermopile infrared (IR) non-contact temperature measurement sensors are available with various lens, and filters allowing use in multiple applications, from industrial pyrometers, to climate controls and medical devices. SMD package offers many advantages for high-volume manufacturing in cutting-edge sensing applications.

A surface mount thermopile infrared sensor is a thermopile infrared sensor with a surface mount package. It is a special infrared sensor, based on the principle of pyroelectric effect, which can convert infrared radiation into electrical signals, and is used to measure and detect the thermal radiation of objects. The packaging of this sensor is suitable for surface mount technology, which is convenient for soldering and integration on the PCB board, and is suitable for various modern electronic products. Thermopile technology provides high sensitivity to detect faint infrared radiation. Surface mount thermopile infrared sensors can respond over a wide range of infrared wavelengths and are suitable for a variety of applications. Compared to some other infrared sensor technologies, thermopile sensors operate without cooling, reducing cost

and energy consumption.
