Abstracts

According to our (Global Info Research) latest study, the global Surgical Anesthesia Management System market size was valued at US\$ 1232 million in 2025 and is forecast to a readjusted size of US\$ 2822 million by 2032 with a CAGR of 12.5% during review period.

The surgical anesthesia management system is an integrated information system used to digitally and informationally manage the entire perioperative period (preoperative, intraoperative, and postoperative) from surgical application to postoperative recovery. Through automatic collection of monitoring data, standardized operating procedures, electronic records, and data sharing, it achieves refined and safe management of the anesthesia process, improving operating room efficiency and medical quality.

The upstream of surgical anesthesia management system software mainly comes from open protocols of medical data interface providers, hospital information system integrators, and surgical anesthesia monitoring equipment manufacturers, as well as suppliers of algorithm frameworks, database engines, and security encryption technologies. Among these, the data interface and algorithm capabilities of monitoring equipment are the parts with high technical barriers. Downstream demand is highly concentrated in general hospitals, specialized hospitals, and surgical centers, which is the core link in the industry chain. Hospitals use such systems to achieve pre-anesthesia assessment, automatic recording of intraoperative vital signs, management of anesthetic drugs, postoperative recovery tracking, and anesthesia quality control analysis, which can significantly reduce manual recording errors and improve anesthesia safety and efficiency. Large tertiary hospitals pay more attention to system compatibility, data accuracy, deep integration with HIS and EMR, and the completeness

of quality management modules; small and medium-sized hospitals value deployment costs, ease of use, and after-sales service. Surgical centers and day surgery institutions are rapidly increasing their demand for process-oriented, visualized, and intelligent management against the backdrop of rapidly growing surgical volumes, which also represents a future growth market.

Industry trends are characterized by deeper data interconnection, cross-device automatic data collection, highly intelligent decision support, and quantifiable anesthesia quality management. AI applications in anesthesia risk prediction, anesthesia depth assessment, and intraoperative event early warning are maturing, and the informatization of the entire operating room process will drive the system to evolve from a recording tool into an intelligent assistant. Driving forces include the continuous increase in surgical volume, hospitals' higher requirements for anesthesia safety and quality control, the promotion of informatization by medical data policies, the increased demand for automated recording due to staff shortages, and the overall trend of digital upgrading of operating rooms. Obstacles include inconsistent data protocols among different brands of monitoring equipment, high integration costs due to the complexity of hospital information systems, differences in clinical staff's reliance on and learning costs of the system, strict medical software access and acceptance processes, and high data security requirements involving drugs and vital signs, resulting in longer project cycles.
