Abstracts

According to our (Global Info Research) latest study, the global Syntactic Foam For ROV market size was valued at US\$ 70.3 million in 2024 and is forecast to a readjusted size of USD 119 million by 2031 with a CAGR of 6.0% during review period.

Syntactic foam is a high strength, low density material generally formed by the binding together of hollow spheres in a polymer matrix. Two types of spheres are used – microscopic glass bubbles (approximate 20-80 μm) and larger composite or injection moulded macrospheres (approx. 3-50 mm). Syntactic foam is a specialized type of buoyant material commonly used in underwater applications, including ROVs. The idea behind syntactic foam is relatively simple. The hollow microspheres provide buoyancy by displacing quite a bit of water relative to their size and weight. When incorporated into the body of an ROV, syntactic foam reduces the overall density of the vehicle. This makes it less dense than water and can help it to float or become neutrally buoyant. The subsea buoyancy material is mainly used underwater. Based on its characteristics of low density and high pressure resistance, it mainly provides the required buoyancy for underwater operation equipment.
