## Abstracts

According to our (Global Info Research) latest study, the global Synthetic Data as a Service (SDaaS) market size was valued at US\$ 659 million in 2025 and is forecast to a readjusted size of US\$ 5268 million by 2032 with a CAGR of 34.5% during review period.

The global gross margin for synthetic data as a service is projected to be approximately 70% by 2025. Synthetic Data as a Service (SDaaS) refers to the continuous generation of artificial data assets by providers through cloud platforms, APIs, or deployable software subscriptions. These assets 'approximate real data in terms of statistical distribution, structural relationships, and business constraints, but do not contain real individual records.' These assets are used for model training, testing and validation, data sharing, and privacy compliance. The core mechanism typically involves using real 'seed data' or rule/generative models to learn the patterns and distribution of the original data, and then generating a controllable, evaluable, and versionable dataset. Compared to traditional anonymization/masking, SDaaS emphasizes a systematic balance between data availability and privacy risks, and provides quality assessment, privacy measurement, audit traceability, and continuous iteration capabilities. The basic definition of synthetic data in authoritative sources is usually described as 'artificial data designed to simulate the characteristics of real-world data,' or 'artificial data with statistical characteristics generated from seed data.'

Synthetic Data as a Service (SDaaS) is evolving from a 'privacy alternative' to a 'data productivity tool.' On one hand, pressures related to data privacy and cross-border compliance are driving companies to reduce the exposure of real data in non-production environments, external collaborations, and supplier evaluations. Regulatory agencies

are also issuing practical guidelines for controlling the risks of synthetic data generation and re-identification, making SDaaS easier to incorporate into compliance frameworks. On the other hand, the demand for long-tail data, scarce data, and controllable testing in scenarios such as generative AI, multimodal computing, and autonomous driving/robotics is significantly increasing, driving the penetration rate of SDaaS in test data management, data sharing, and model training and validation. Meanwhile, the industry's key dividing line is shifting from 'ability to generate' to 'verifiability, traceability, and governance.' Authoritative institutions and research indicate that repeatedly using model-generated data without governance and verification may lead to performance degradation or 'model collapse.' Therefore, leading SDaaS products typically strengthen privacy metrics, data lineage, quality benchmarks, and strategies for mixing synthetic and real data to form an auditable data loop.
