## Abstracts

According to our (Global Info Research) latest study, the global Synthetic Data Generation APIs market size was valued at US\$ 659 million in 2025 and is forecast to a readjusted size of US\$ 5268 million by 2032 with a CAGR of 34.5% during review period.

The global gross margin for synthetic data-as-a-service is projected to be around 70% by 2025. Synthetic data generation refers to the process of creating artificial data that closely resembles real-world data in terms of patterns, structure, and statistical properties. It is widely used in fields such as artificial intelligence, machine learning, data privacy, and software testing, with the primary goal of generating data that can be used for analysis, training, or testing without relying on sensitive or difficult-to-access real-world data. By mimicking the characteristics of real-world data, synthetic data generators offer a privacy-focused alternative, making them ideal for industries where data compliance is critical, such as healthcare or finance. It is also highly useful when real-world data is scarce, expensive, or difficult to collect, such as rare events or elusive edge cases. Techniques such as generative adversarial networks (GANs), rule-based simulation, or statistical modeling help generate synthetic data that can be tailored to specific scenarios, whether for training AI models, simulating customer behavior, or testing software systems. While synthetic data offers numerous advantages—such as privacy protection, cost savings, and facilitating experimentation—it is not without its challenges. Poor-quality synthetic data may inherit biases from real-world data or fail to accurately reflect the complexities of real-world scenarios. However, when used properly, synthetic data can be transformative, making data-driven innovation more accessible, scalable, and secure. Accessing synthetic data via APIs offers significant advantages in gaining insights and increasing productivity. APIs provide a standardized

way to interact with synthetic data generation tools, enabling developers to automate the data retrieval and integration process. This automation reduces human intervention, allowing teams to focus on analyzing data and deriving actionable insights.

Synthetic Data as a Service (SDaaS) is evolving from a 'privacy alternative' to a 'data productivity tool.' On one hand, pressures related to data privacy and cross-border compliance are driving companies to reduce the exposure of real data in non-production environments, external collaborations, and supplier evaluations. Regulatory agencies are also issuing practical guidelines for controlling the risks of synthetic data generation and re-identification, making SDaaS easier to incorporate into compliance frameworks. On the other hand, the demand for long-tail data, scarce data, and controllable testing in scenarios such as generative AI, multimodal computing, and autonomous driving/robotics is significantly increasing, driving the penetration rate of SDaaS in test data management, data sharing, and model training and validation. Meanwhile, the industry's key dividing line is shifting from 'ability to generate' to 'verifiability, traceability, and governance.' Authoritative institutions and research indicate that repeatedly using model-generated data without governance and verification may lead to performance degradation or 'model collapse.' Therefore, leading SDaaS products typically strengthen privacy metrics, data lineage, quality benchmarks, and strategies for mixing synthetic and real data to form an auditable data loop.
