According to our (Global Info Research) latest study, the global Targeted Therapy Drugs for Cancer market size was valued at US\$ 124495 million in 2025 and is forecast to a readjusted size of US\$ 196419 million by 2032 with a CAGR of 7.1% during review period.

In 2025, global Targeted Therapy Drugs for Cancer reached approximately 58.76 M Units, with an average global market price of around 2059 USD per Unit.

Targeted therapy drugs for cancer are anticancer medicines designed to specifically interfere with molecular targets—such as mutated genes, abnormal proteins, or dysregulated signaling pathways—that drive the growth, survival, or spread of cancer cells. These targets are typically involved in processes like cell proliferation, angiogenesis, DNA repair, or immune evasion, and are more active or uniquely altered in cancer cells compared with normal cells.

Unlike traditional chemotherapy, which broadly affects rapidly dividing cells, targeted cancer therapies act in a more precise and mechanism-driven manner, aiming to block cancer-specific biological processes while minimizing damage to healthy tissues. They include small-molecule drugs (often taken orally and acting inside cells) and biologic agents such as monoclonal antibodies (usually acting on cell-surface targets or extracellular ligands). Targeted therapies are commonly selected based on biomarker or genetic testing, making them a central component of precision oncology.

The upstream raw materials for Targeted Therapy Drugs for Cancer mainly include active pharmaceutical ingredients (APIs), pharmaceutical intermediates, and excipients.

Typical suppliers include Pfizer, Roche, Merck, and AstraZeneca. Downstream applications are primarily in oncology and rare disease treatments.

The single-line production capacity of Targeted Therapy Drugs for Cancer varies significantly depending on the drug molecule type, process complexity, equipment scale, and production mode. Industry gross margins typically range from 60% to 80%.
