According to our (Global Info Research) latest study, the global Through-beam Ultrasonic Sensor market size was valued at US\$ 1347 million in 2024 and is forecast to a readjusted size of USD 1947 million by 2031 with a CAGR of 5.5% during review period.

A through-beam ultrasonic sensor is a type of sensor that uses ultrasonic waves to detect the presence or absence of an object. It consists of two separate components: a transmitter and a receiver. The transmitter emits ultrasonic waves, which are then received by the receiver. When an object is present between the transmitter and receiver, the waves are blocked or reflected, causing a change in the received signal. This change in signal is used to determine the presence or absence of the object. Through-beam ultrasonic sensors are commonly used in industrial automation applications for object detection, distance measurement, and level sensing.
