Transdermal patch detection systems are an innovative medical technology that embeds micro-sensors and electronic components into flexible patches and attaches them to the surface of the skin to continuously monitor and collect various physiological parameters, such as blood sugar levels, heart rate, respiratory rate, body temperature, etc. These systems can transmit data in real time, provide immediate health status feedback, and help patients and medical staff to accurately manage their health and monitor diseases. Transdermal patch detection systems are widely used in many fields such as diabetes management, heart monitoring, drug intake tracking, and sports rehabilitation due to their non-invasiveness, convenience, and efficiency.

The transdermal patch detection system represents the forefront of medical technology. Through non-invasive, real-time monitoring of various physiological parameters, it greatly improves the accuracy and convenience of disease management and health monitoring. This technology not only provides better self-management tools for patients with chronic diseases, but also provides valuable continuous data support for medical staff, thereby optimizing treatment plans and improving medical quality. The widespread application of the transdermal patch detection system will promote the development of

personalized medicine and preventive medicine, and have a profound impact on improving global health.
