## Abstracts

According to our latest research, the global Type I Anodizing Service market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

Type I Anodizing is an electrochemical process that creates a thin aluminum oxide film by rapidly controlling the oxidation of an aluminum surface. The resulting aluminum oxide film is electrically non-conductive. The active ingredient in Type I Anodizing is chromic acid. Type I anodizing produces a thinner film than Type II and Type III Anodizing (hard coat) and produces enhanced drawing and forming characteristics. Chromic acid anodizing is used for flight-critical aluminum components that are subjected to high stresses, such as landing gear. Type I Chromic Acid Anodizing works best on aluminum with few alloying elements.
