Ultrasonic-Assisted Wound Debridement (UAWD) is a medical procedure that uses ultrasonic energy to clean and remove dead or infected tissue from wounds, promoting faster and more effective healing. This technique employs high-frequency sound waves delivered through a specialized device, which creates gentle vibrations and microbubbles that help dislodge and break down necrotic tissue without damaging healthy tissue. UAWD is particularly beneficial for chronic, hard-to-heal wounds, such as those found in diabetic foot ulcers, pressure sores, and severe burns. It offers a less painful and more precise alternative to traditional debridement methods, reducing infection risk and enhancing overall wound care outcomes.
