Ultrasonic cutting hemostatic blade is a commonly used medical device in surgical operations, especially in situations where tissue cutting and hemostasis are required. The working principle of the ultrasonic cutting hemostatic blade is based on the characteristics of sound wave energy transfer and tissue change. The transducer converts electrical energy into mechanical energy. The ultrasonic system in the handle converts electrical energy into high-frequency sound wave signals. It has the characteristics of accurate cutting and hemostasis, improved surgical efficiency, reduced thermal damage, and clear surgical field of view. It is widely used in various surgical operations, especially in situations where fine cutting and hemostasis are required.
