Ultrasound-guided non-invasive diagnosis of liver fibrosis can simultaneously obtain two indicators, the degree of liver fibrosis and the quantitative fatty liver, for the quantitative detection of liver fibrosis and fatty liver. This technology is suitable for all people of medium body size, and can roughly determine the degree of liver fibrosis without liver biopsy.

The devices currently available in the medical community to assess liver fibrosis and liver stiffness include Fibroscan and Acoustic Radiation Force Impulse imaging (ARFI, Acoustic Radiation Force Impulse imaging), two commonly used ultrasound instruments, as well as magnetic resonance imaging with special software. Imaging instruments, etc. Among them, liver fiber scanner should be the most commonly used method in clinical examination at present.

This report is a detailed and comprehensive analysis for global Ultrasound-guided Non-invasive Diagnostic of Liver Fibrosis market. Both quantitative and qualitative analyses are presented by manufacturers, by region & country, by Technology and by
