Abstracts

An ice cream machine is a machine used to make quantities of ice cream for consumption. Ice cream machine may prepare the mixture by employing the hand-cranking method or by employing an electric motor. The resulting preparation is often chilled through either pre-cooling the machine or by employing a machine that freezes the mixture. An ice cream machine has to simultaneously freeze the mixture while churning it so as to aerate the mixture and avoid ice crystals. As a result, most ice creams are ready to consume immediately. However, those containing alcohol must often be chilled further to attain a firm consistency. Some machines, such as certain lower-priced countertop models, do require that the resulting mixture be frozen for additional time after churning is complete.
